## Notes from Oct 29, 2014 meeting

We want to relate observables to the 2D PDF of  $\psi_s$ :

$$(\alpha, \delta, e_1, e_2, \sigma_e) \to Pr(\psi_s)$$
 (1)

Note that  $e_1$  and  $e_2$  are related to  $g_1$ ,  $g_2$  not  $\gamma_1$ ,  $\gamma_2$  directly.

#### Steps

- 0. generate Gaussian  $\psi$ 
  - fit  $\hat{\psi}$
- 1. Calculate  $\gamma$ ,  $\kappa$ , from  $\psi$ 
  - fit  $\gamma$ ,  $\kappa$
  - need to regularize  $\Sigma$  (covariance matrix) to ensure smoothness among other physical conditions

#### distance and metric

 $r = \Delta x^T D^{-1} \Delta x$ , where we have used a Euclidean metric D (to be consistent with Michael's notation),

$$D = \beta \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, \tag{2}$$

with  $\beta = -\frac{1}{4} \ln \rho$ , but we can choose another metric later on.

### details of step 0

$$\psi_s \sim GP(0, \Sigma),$$
(3)

where,

$$\Sigma = \Sigma(\lambda, \rho) \tag{4}$$

$$=\lambda^{-1}K(\rho),\tag{5}$$

and we may want a Matérn covariance function, according to Michael,

$$K(\lambda, \rho) = \exp^{-\beta a(\Delta\alpha^2 + \Delta\delta^2)}$$
(6)

$$= \rho^{4a(\Delta\alpha^2 + \Delta\delta^2)},\tag{7}$$

with  $\rho \in [0,1]$ , Note: RA and DEC need to be in units of radians

Depending the degrees of freedom (d.o.f.) of the Matérn function, if  $d.o.f \rightarrow \infty$ , it's just a squared exponential kernel

$$K(l;s) = \exp\left(-\frac{s^2}{2l^2}\right) \tag{8}$$

with  $s = \sqrt{\Delta \alpha^2 + \Delta \delta^2}$  and l is the characteristic length scale over which large fluctuation in the signal occurs. In our case, the characteristic length is:e :

$$l = \frac{1}{\sqrt{2a\beta}} = \sqrt{-\frac{2}{a\ln\rho}}\tag{9}$$

# technical challenges

• come up with conditional update rule - make use of Schur compliments

### steps 1

make use of the fact that  $\gamma$  and  $\kappa$  are derivatives of the scalar potential  $\psi_s$ :

$$\gamma_1, \gamma_2 \sim GP(0, \Sigma_{xx,yy}^{\gamma}(x, y)) \tag{10}$$

$$\kappa \sim GP(0, \Sigma_{xx,yy}^{\kappa}(x,y)) \tag{11}$$

eqns (8) and (9) are in the draft of the paper also.
